

Package ‘PFoptim’

November 3, 2021

Type Package

Title Global Stochastic Optimization using a Particle Filter Algorithm

Version 1.0

Date 2021-07-27

Author Mathieu Gerber

Maintainer Mathieu Gerber <mathieu.gerber@bristol.ac.uk>

Description This package implements the G-PFSO (Global Particle Filter Stochastic Optimization) algorithm of Gerber and Douc (2021) for finding the global minimizer of a function defined through an expectation. Informally speaking, G-PFSO can be seen as a particle and derivative-free version of stochastic gradient methods.

PFoptim-package

The 'PFoptim' package: summary information

Description

The package provides an implementation of the G-PFSO (Global Particle Filter Stochastic Optimization) algorithm of Gerber and Douc (2021) for finding the global minimizer of a function defined through an expectation. In addition, a function for implementing the SSP resampling algorithm (Gerber et al. 2019) and a function for implementing the Stratified resampling algorithm are also provided.

gpfs

Global Particle filter Stochastic Optimization

Description

This function implements the G-PFSO (Global Particle Filter Stochastic Optimization) algorithm of Gerber and Douc (2021) for minimizing either the function $\theta \mapsto E[\text{fn}(\theta, Y)]$ from i.i.d. realizations y_1, \dots, y_n of Y or the function $\theta \mapsto \sum_{i=1}^n \text{fn}(\theta, y_i)$, where θ is a vector of dimension d .

Usage

```
gpfs(y, N, fn, init, numit, ..., resampling=c("SSP", "STRAT", "MULTI"), control= list())
```

Arguments

y	Either a vector of observations or a matrix of observations (the number of rows being the sample size).
N	Number of particles. The parameter N must be greater or equal to 2.

<code>fn</code>	function for a single observation. If <code>theta</code> is an N by d matrix and <code>y</code> is a matrix then <code>fn(theta,y[i,])</code> must be a vector of length N. Similarly, if <code>theta</code> is an N by d matrix and <code>y</code> is a vector then <code>fn(theta,y[i])</code> must be a vector of length N. If some rows of <code>theta</code> are outside the search space then the corresponding entries of the vector <code>fn(theta,y[i,])</code> must be equal to Inf.
<code>init</code>	Function used to sample the initial particles such that <code>init(N)</code> is an N by d matrix (or alternatively a vector of length N if d=1).
<code>...</code>	Further arguments to be passed to <code>fn</code> .
<code>numit</code>	Number of iterations of the algorithm. If <code>numit</code> is not specified then G-PFSO estimates the minimizer of the function $E[\text{fn}(\theta, Y)]$ (in which case the observations are processed sequentially and <code>numit</code> is equal to the sample size). If <code>numit</code> is specified then G-PFSO computes the minimizer of the function $\sum_{i=1}^n \text{fn}(\theta, y_i)$.
<code>resampling</code>	Resampling algorithm to be used. Resampling should be either "SSP" (SSP resampling), "STRAT" (stratified resampling) or "MULTI" (multinomial resampling).
<code>control</code>	A list of control parameters. See details.

Details

Note that arguments after `...` must be matched exactly.

G-PFSO computes two estimators of the minimizer of the objective function, namely the estimators $\bar{\theta}_{\text{numit}}^N$ and $\tilde{\theta}_{\text{numit}}^N$. The former is defined by $\bar{\theta}_{\text{numit}}^N = \frac{1}{\text{numit}} \sum_{t=1}^{\text{numit}} \tilde{\theta}_t^N$ and converges to a particular element of the search space at a faster rate than the latter, but the latter estimator can find more quickly a small neighborhood of the minimizer of the objective function.

By default the sequence $(t_p)_{p \geq 0}$ is taken as

$$t_p = t_{p-1} + \lceil \max(A t_{p-1}^\varrho \log(t_{p-1}), B) \rceil$$

with $A=B=1$, $\varrho = 0.1$ and $t_0 = 5$. The value of A, B, ϱ and t_0 can be changed using the control argument (see below).

The control argument is a list that can supply any of the following components:

alpha: Parameter α of the learning rate $t^{-\alpha}$, which must be a strictly positive real number. By default, `alpha=0.5`.

Sigma: Scale matrix used to sample the particles. Sigma must be either a d by d covariance matrix or a strictly positive real number. In this latter case the scale matrix used to sample the particles is `diag(Sigma, d)`. By default, `Sigma=1`.

trace: If `trace=TRUE` then the value of $\tilde{\theta}_t$ and of the effective sample size ESS_t for all $t = 1, \dots, \text{numit}$ are returned. By default, `trace=FALSE`.

indep: If `indep=TRUE` and Sigma is a diagonal matrix or a scalar then the Student's t-distributions have independent components. By default, `indep=TRUE` and if Sigma is a not a diagonal matrix this parameter is ignored.

A: Parameter A of the sequence $(t_p)_{p \geq 0}$ used by default (see above). This parameter must be strictly positive.

- B:** Parameter B of the sequence $(t_p)_{p \geq 0}$ used by default (see above). This parameter must non-negative.
- varrho:** Parameter varrho of the sequence $(t_p)_{p \geq 0}$ used by default (see above). This parameter must be in the interval (0,1).
- t0:** Parameter t_0 of the the sequence $(t_p)_{p \geq 0}$ used by default (see above). This parameter must be a non-negative integer.
- nu:** Number of degrees of freedom of the Student's t-distributions used at time $t \in (t_p)_{\geq 0}$ to generate the new particles. By default nu=10
- c_ess:** A resampling step is performed when $ESS_t \leq N_{c_{ess}}$. This parameter must be in the interval (0,1] and by default c_ess=0.7.

Value

A list with the following components:

B_par	Value of $\bar{\theta}_{\text{numit}}^N$
T_par	Value of $\bar{\theta}_{\text{numit}}^N$
T_hist	Value of $\tilde{\theta}_t^N$ for $t = 1, \dots, \text{numit}$ (only if trace=TRUE)
ESS	Value of the effective sample for $t = 1, \dots, \text{numit}$ (only if trace=TRUE)

Examples

```
#Definition of fn
fn_toy<-function(theta, obs){
  test<-rep(0,nrow(theta))
  test[theta[,2]>0]<-1
  ll<-rep(-Inf,nrow(theta))
  ll[test==1]<-dnorm(obs,mean=theta[test==1,1], sd=theta[test==1,2],log=TRUE)
  return(-ll)
}
#Generate data y_1,...,y_n
n<-10000 #sample size
theta_star<-c(0,1) #true parameter value
y<-rnorm(n,mean=theta_star[1], sd=theta_star[2])
d<-length(theta_star)
#Define init function to be used
pi0<-function(N){
  return(cbind(rnorm(N,0,5), rexp(N)))
}
##Example 1: Maximum likelihood estimation in the Gaussian model
##true value of the MLE
mle<-c(mean(y),sd(y))
## use gpfso to compute the MLE
Est<-gpfso(y, N=100, fn=fn_toy, init=pi0, numit=20000, control=list(trace=TRUE))
```

```

## print  $\bar{\theta}^{N_{\text{numit}}}$  and  $\tilde{\theta}^{N_{\text{numit}}}$ 
print(Est$B_par)
print(Est$T_par)
##assess convergence
par(mfrow=c(1,2))
for(k in 1:2){
  plot(Est$T_hist[,k],type='l', xlab="iteration", ylab="approximation error")
  lines(cumsum(Est$T_hist[,k])/1:length(Est$T_hist[,k]),type='l', col='red')
  abline(h=mle[k])
}
##Example 2: Expected log-likelihood estimation in the Gaussian model
## Estimation of theta_star using gpfso
Est<-gpfso(y, N=100, fn=fn_toy, init=pi0, control=list(trace=TRUE))
## print  $\bar{\theta}^{N_{\text{numit}}}$  and  $\tilde{\theta}^{N_{\text{numit}}}$ 
print(Est$B_par)
print(Est$T_par)
##assess convergence
par(mfrow=c(1,2))
for(k in 1:2){
  plot(Est$T_hist[,k],type='l', xlab="iteration", ylab="approximation error")
  lines(cumsum(Est$T_hist[,k])/1:length(Est$T_hist[,k]),type='l', col='red')
  abline(h=theta_star[k])
}

```

SSP_Resampler

*SSP resampling***Description**

This function implements the SSP resampling algorithm (Gerber et al. 2019).

Usage

```
SSP_Resampler(U,W)
```

Arguments

W A vector of normalized weights.

U A vector of points in (0,1) such that $\text{length}(U)=\text{length}(W)$.

Details

For efficiency reasons, SSP_Resampler does not perform checks on the supplied arguments.

Value

A vector of length N with elements in the set $\{1, \dots, N\}$, with $N=\text{length}(U)=\text{length}(W)$.

References

Gerber M, Chopin N, Whiteley N (2019). “Negative association, ordering and convergence of resampling methods.” *The Annals of Statistics*, **47**(4), 2236–2260.

Examples

```
N<-100
W<-rbeta(N,0.5,2)
W<-W/sum(W)
J<-SSP_Resampler(runif(N),W)
```

Stratified_Resampler	<i>Stratified resampling</i>
----------------------	------------------------------

Description

This function implements the stratified resampling algorithm described see e.g. in Section 9.6 of Chopin and Papaspiliopoulos (2020)

Usage

```
Stratified_Resampler(U,W)
```

Arguments

W	A vector of normalized weights.
U	A vector of points in (0,1) such that $\text{length}(U)=\text{length}(W)$.

Details

For efficiency reasons, Stratified_Resampler does not perform checks on the supplied arguments.

Value

A vector of length N with elements in the set $\{1, \dots, N\}$, with $N=\text{length}(U)=\text{length}(W)$.

References

Chopin N, Papaspiliopoulos O (2020). *An introduction to sequential Monte Carlo*, volume 4. Springer.

Examples

```
N<-100
W<-rbeta(N,0.5,2)
W<-W/sum(W)
J<-Stratified_Resampler(runif(N),W)
```
