# Package 'PFoptim'

December 1, 2021

Type Package		
Title Global Stochastic Optimization using a Particle Filter Algorithm		
Version 1.0		
Date 2021-07-27		
Author Mathieu Gerber		
Maintainer Mathieu Gerber <mathieu.gerber@bristol.ac.uk></mathieu.gerber@bristol.ac.uk>		
<b>Description</b> This package implements the G-PFSO (Global Particle Filter Stochastic Optimization) algorithm of Gerber and Douc (2021) for finding the global minimizer of a function defined through an expectation. Informally speaking, G-PFSO can be seen as a particle and derivative-free version of stochastic gradient methods.

PFoptim-package

The 'PFoptim' package: summary information

#### **Description**

The package provides an implementation of the G-PFSO (Global Particle Filter Stochastic Optimization) algorithm of Gerber and Douc (2021) for finding the global minimizer of a function defined through an expectation. In addition, a function for implementing the SSP resampling algorithm(Gerber et al. 2019) and a function for implementating the Stratified resampling algorithm are also provided.

#### Author(s)

Mathieu Gerber

Maintainer: Mathieu Gerber <mathieu.gerber@bristol.ac.uk>

gpfso

Global Particle filter Stochastic Optimization

# **Description**

This function implements the G-PFSO (Global Particle Filter Stochastic Optimization) algorithm of Gerber and Douc (2021) for minimzing either the function  $\theta \mapsto E[\operatorname{fn}(\theta,Y)]$  from i.i.d. realizations  $y_1,...,y_n$  of Y or the function  $\theta \mapsto \sum_{i=1}^n \operatorname{fn}(\theta,y_i)$ , where  $\theta$  is a vector of dimension d.

# Usage

```
gpfso(obs, N, fn, init, numit, resampling=c("SSP", "STRAT", "MULTI"), ..., control= list())
```

#### **Arguments**

obs	Either a vector of observations or a matrix of observations (the number of rows
	being the sample size).

NT 1 C (1 TT)

N Number of particles. The parameter N must be greater or equal to 2.

gpfso 3

fn function for a single observation. If theta is an N by d matrix and y is a single observation (i.e. y is a scalar if obs is a vector and a vector if obs is a matrix) then fn(theta,y) must be a vector of length N. If some rows of theta are outside the search space then the corresponding entries of the vector fn(theta,y) must be equal to Inf.

Function used to sample the initial particles such that init(N) is an N by d matrix (or alternatively a vector of length N if d=1).

Number of iterations of the algorithm. If numit is not specified then G-PFSO estimates the minimizer of the function  $E[\operatorname{fn}(\theta,Y)]$  (in which case the observations are processed sequentially and numit is equal to the sample size). If numit is specified then G-PFSO computes the minimizer of the function  $\sum_{i=1}^{n}\operatorname{fn}(\theta,y_i)$ .

Resampling algorithm to be used. Resamping should be either "SSP" (SSP resampling), "STRAT" (stratified resampling) or "MULTI" (multinomial resampling)

... Further arguments to be passed to fn.

control A list of control parameters. See details.

#### **Details**

init

numit

resampling

Note that arguments after . . . must be matched exactly.

G-PFSO computes two estimators of the minimizer of the objective function, namely the estimators  $\bar{\theta}_{\mathrm{numit}}^N$  and  $\tilde{\theta}_{\mathrm{numit}}^N$ . The former is defined by  $\bar{\theta}_{\mathrm{numit}}^N = \frac{1}{\mathrm{numit}} \sum_{t=1}^{\mathrm{numit}} \tilde{\theta}_t^N$  and converges to a particular element of the search space at a faster rate than the latter, but the latter estimator can find more quickly a small neighborhood of the minimizer of the objective function.

By default the sequence  $(t_p)_{p>0}$  is taken as

$$t_p = t_{p-1} + \lceil \max\left(At_{p-1}^{\varrho} \log(t_{p-1}), B\right) \rceil$$

with A=B=1,  $\varrho=0.1$  and  $t_0=5$ . The value of  $A,B,\varrho$  and  $t_0$  can be changed using the control argument (see below).

The control argument is a list that can supply any of the following components:

**alpha:** Parameter  $\alpha$  of the learning rate  $t^{-\alpha}$ , which must be a strictly positive real number. By default, alpha=0.5.

**Sigma:** Scale matrix used to sample the particles. Sigma must be either a d by d covariance matrix or a strictly positive real number. In this latter case the scale matrix used to sample the particles is diag(Sigma, d). By default, Sigma=1.

**trace:** If trace=TRUE then the value of  $\tilde{\theta}_t$  and of the effective sample size  $ESS_t$  for all  $t=1,\ldots,\text{numit}$  are returned. By default, trace=FALSE.

**indep:** If indep=TRUE and Sigma is a diagonal matrix or a scalar then the Student's t-distributions have independent components. By default, indep=FALSE and if Sigma is a not a diagonal matrix this parameter is ignored.

**A:** Parameter A of the sequence  $(t_p)_{p\geq 0}$  used by default (see above). This parameter must be strictly positive.

4 gpfso

**B:** Parameter B of the sequence  $(t_p)_{p\geq 0}$  used by default (see above). This parameter must nonnegative.

**varrho:** Parameter varrho of the sequence  $(t_p)_{p\geq 0}$  used by default (see above). This parameter must be in the interval (0,1).

- **t0:** Parameter  $t_0$  of the sequence  $(t_p)_{p\geq 0}$  used by default (see above). This parameter must be a non-negative integer.
- **nu:** Number of degrees of freedom of the Student's t-distributions used at time  $t \in (t_p)_{\geq 0}$  to generate the new particles. By default nu=10
- **c\_ess:** A resamling step is performed when  $ESS_t <= Nc_{ess}$ . This parameter must be in the interval (0,1] and by default c\_ess=0.7.

#### Value

A list with the following components:

```
B_par Value of \bar{\theta}_{\mathrm{numit}}^N Value of \tilde{\theta}_{\mathrm{numit}}^N T_hist Value of \tilde{\theta}_t^N for t=1,..., numit (only if trace=TRUE) Value of the effective sample for t=1,..., numit (only if trace=TRUE)
```

# **Examples**

```
#Definition of fn
fn_toy<-function(theta, obs){</pre>
 test<-rep(0,nrow(theta))</pre>
 test[theta[,2]>0]<-1
 11<-rep(-Inf,nrow(theta))</pre>
 ll[test==1]<-dnorm(obs,mean=theta[test==1,1], sd=theta[test==1,2],log=TRUE)
 return(-11)
}
#Generate data y_1,...,y_n
n<-10000
                     #sample size
theta_star<-c(0,1) #true parameter value
y<-rnorm(n,mean=theta_star[1], sd=theta_star[2])
d<-length(theta_star)</pre>
#Define init funciton to be used
pi0<-function(N){</pre>
    return(cbind(rnorm(N, 0, 5), rexp(N)))
##Example 1: Maximum likelihood estimation in the Gaussian model
##true value of the MLE
mle < -c(mean(y), sd(y))
## use gpfso to compute the MLE
Est<-gpfso(y, N=100, fn=fn_toy, init=pi0, numit=20000, control=list(trace=TRUE))
```

SSP\_Resampler 5

```
## print \bar{\theta}^N_{numit} and \tilde{\theta}^N_{numit}
print(Est$B_par)
print(Est$T_par)
##assess convergence
par(mfrow=c(1,2))
for(k in 1:2){
  plot(Est$T_hist[,k],type='l', xlab="iteration", ylab="estimated value")
  lines(cumsum(Est$T_hist[,k])/1:length(Est$T_hist[,k]),type='1', col='red')
  abline(h=mle[k])
}
##Example 2: Expected log-likelihood estimation in the Gaussian model
## Estimation of theta_star using gpfso
Est<-gpfso(y, N=100, fn=fn_toy, init=pi0, control=list(trace=TRUE))</pre>
## print \bar{\theta}^N_{numit} and \tilde{\theta}^N_{numit}
print(Est$B_par)
print(Est$T_par)
##assess convergence
par(mfrow=c(1,2))
for(k in 1:2){
  plot(Est$T_hist[,k],type='l', xlab="iteration", ylab="estimated value")
  lines(cumsum(Est$T_hist[,k])/1:length(Est$T_hist[,k]),type='1', col='red')
  abline(h=theta_star[k])
}
```

SSP\_Resampler

SSP resampling

#### **Description**

This function implements the SSP resampling algorithm (Gerber et al. 2019).

# Usage

```
SSP_Resampler(U,W)
```

#### Arguments

W A vector of normalized weights.

U A vector of points in (0,1) such that length(U)=length(W).

#### **Details**

For efficiency reasons, SSP\_Resampler does not perform checks on the supplied arguments.

#### Value

A vector of length N with elements in the set  $\{1, ..., N\}$ , with N=length(U)=length(W).

#### References

Gerber M, Chopin N, Whiteley N (2019). "Negative association, ordering and convergence of resampling methods." *The Annals of Statistics*, **47**(4), 2236–2260.

# **Examples**

```
N<-100
W<-rbeta(N,0.5,2)
W<-W/sum(W)
J<-SSP_Resampler(runif(N),W)</pre>
```

Stratified\_Resampler Stratified resampling

# Description

This function implements the stratified resampling algorithm descibed see e.g. in Section 9.6 of Chopin and Papaspiliopoulos (2020)

#### Usage

```
Stratified_Resampler(U,W)
```

#### **Arguments**

W A vector of normalized weights.

U A vector of points in (0,1) such that length(U)=length(W).

#### **Details**

For efficiency reasons, Stratified\_Resampler does not perform checks on the supplied arguments.

# Value

A vector of length N with elements in the set  $\{1, ..., N\}$ , with N=length(U)=length(W).

#### References

Chopin N, Papaspiliopoulos O (2020). *An introduction to sequential Monte Carlo*, volume 4. Springer.

#### **Examples**

```
N<-100
W<-rbeta(N,0.5,2)
W<-W/sum(W)
J<-Stratified_Resampler(runif(N),W)</pre>
```
